Data Source Description

The Diwali Sales Dataset includes transactional data from several locations of India during the Diwali season. Customers' demographics, product categories, total spending amounts, and regional data are all included in the dataset. It offers a full perspective of sales trends throughout this peak shopping season, allowing for exploratory data analysis and predictive modeling.

Background Motivation

- Diwali, a prominent celebration in India, boosts consumer activity, particularly in the retail and e-commerce industries. Analyzing Diwali sales reveals client preferences, geographical demand trends, and the efficacy of marketing initiatives during peak shopping seasons.
- This type of data can help organizations optimize inventory, design targeted promotions, and increase revenue.

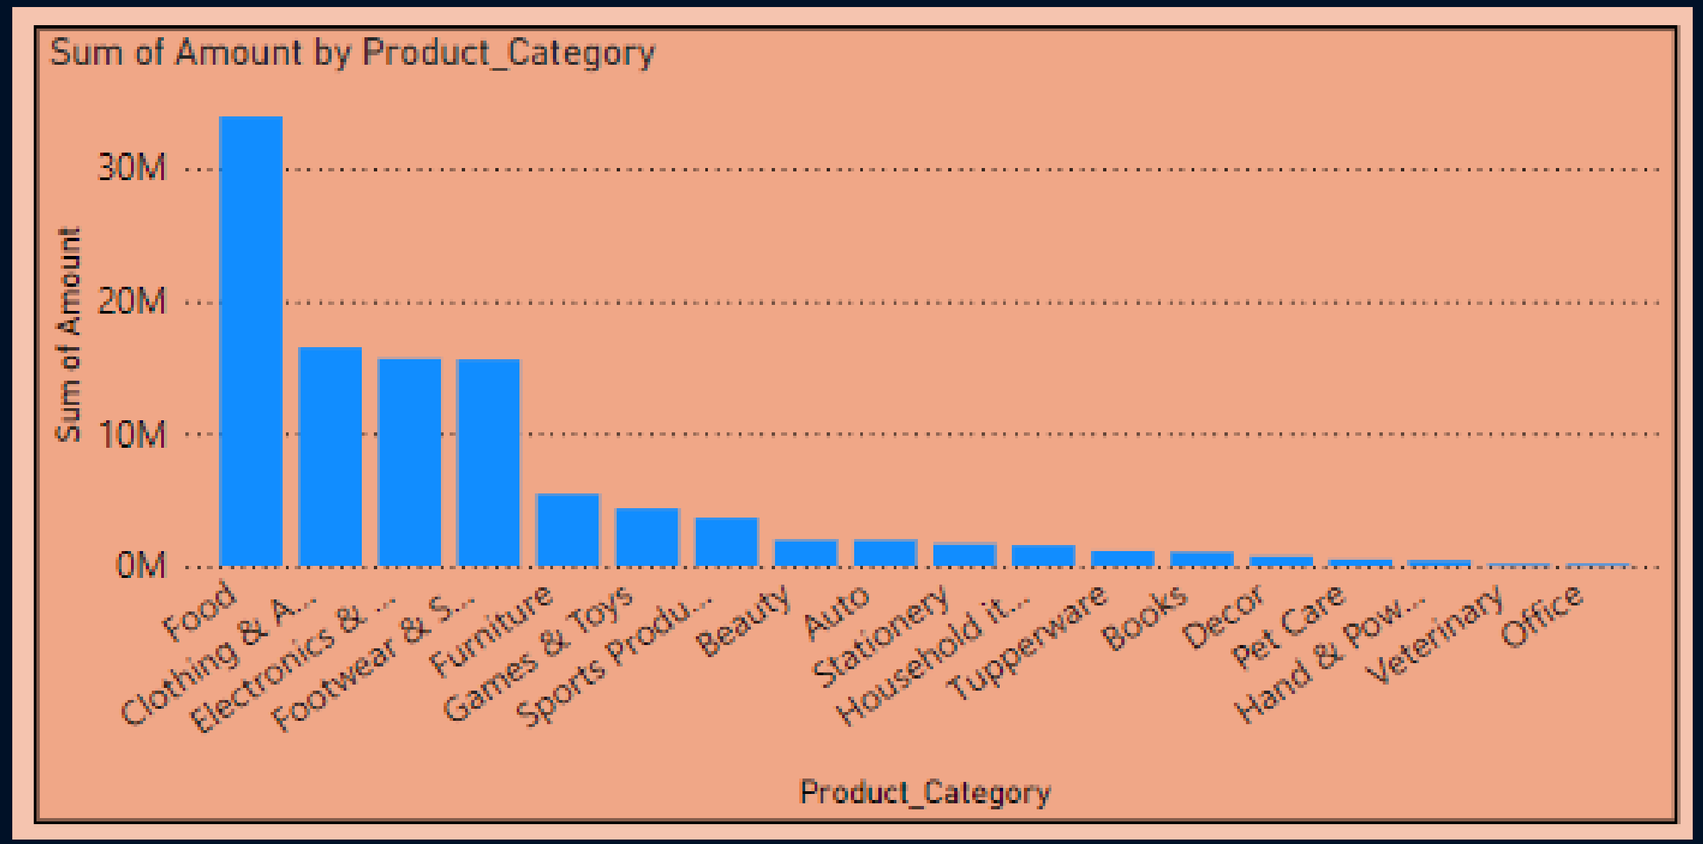
Problem Statement

- The primary challenge is understanding consumer behavior during Diwali sales.
- This involves identifying factors influencing sales volume, regional purchasing trends, and the effectiveness of discounts or marketing campaigns.
- Additionally, businesses aim to predict future sales patterns and design better strategies to cater to diverse customer needs.

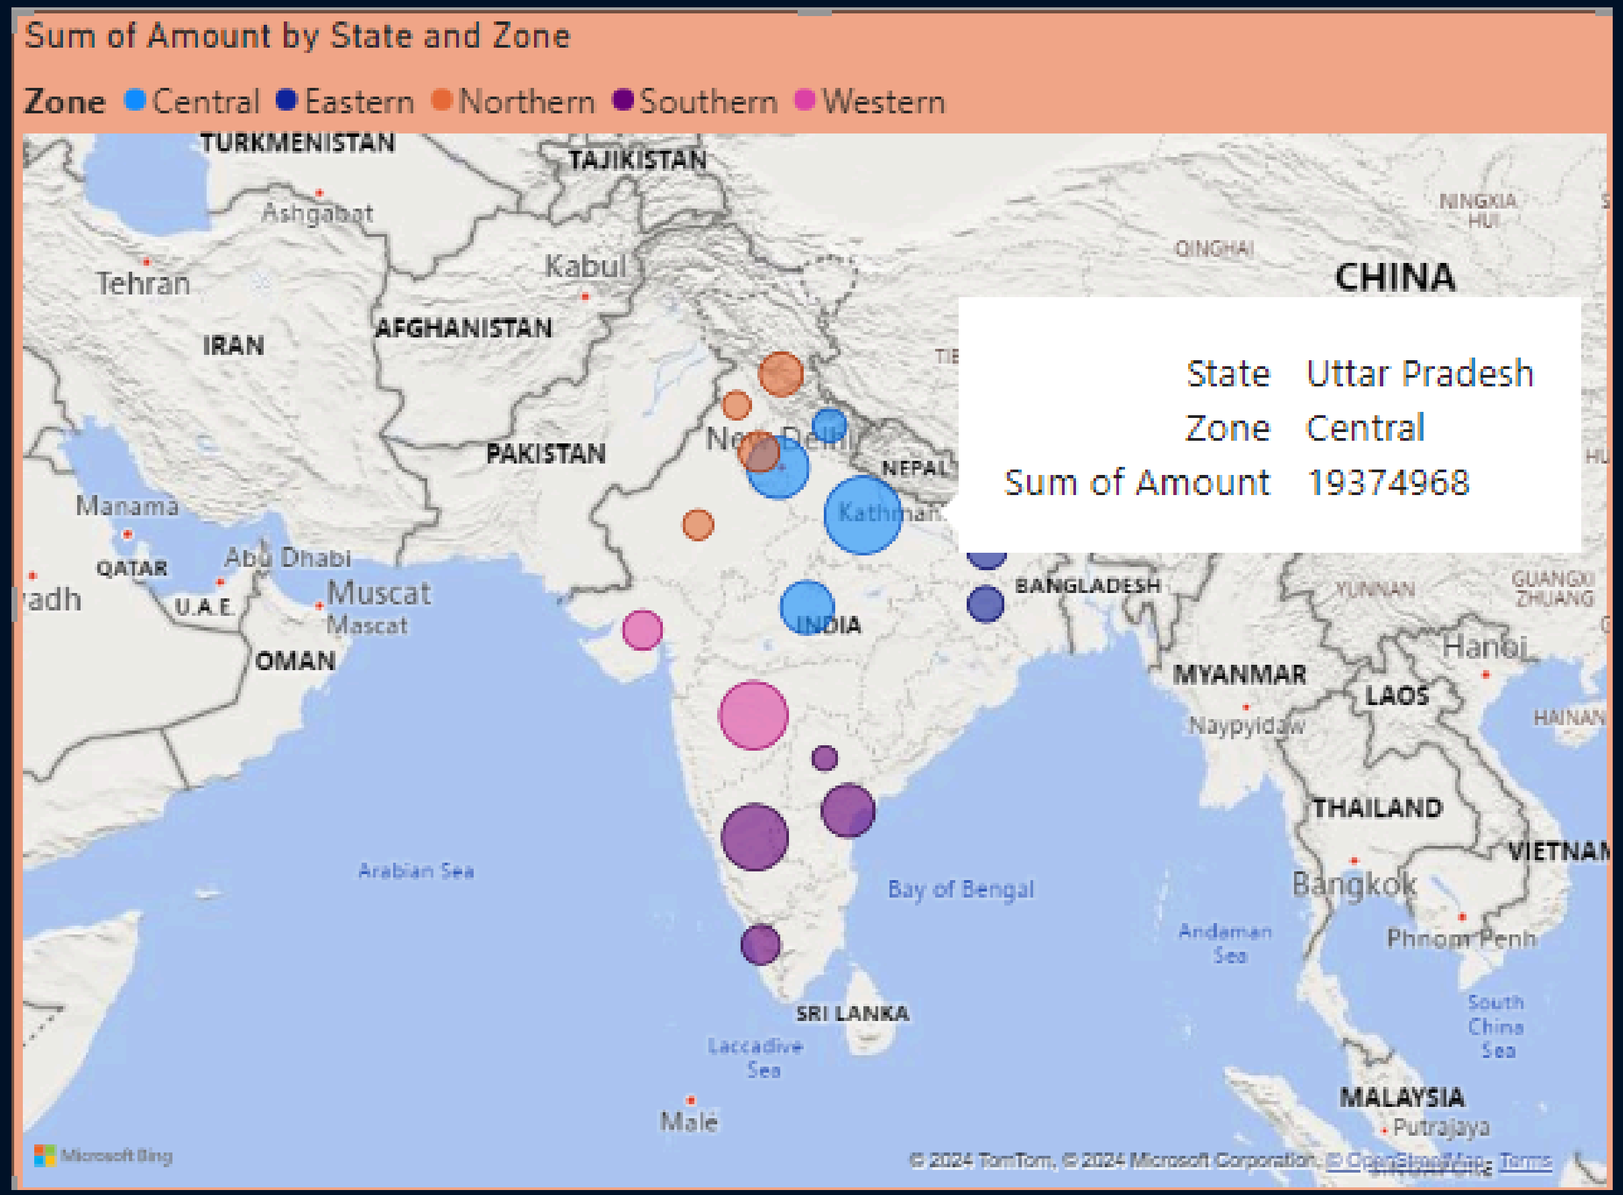
Analysis Questions

Based on the dataset and the motivation:

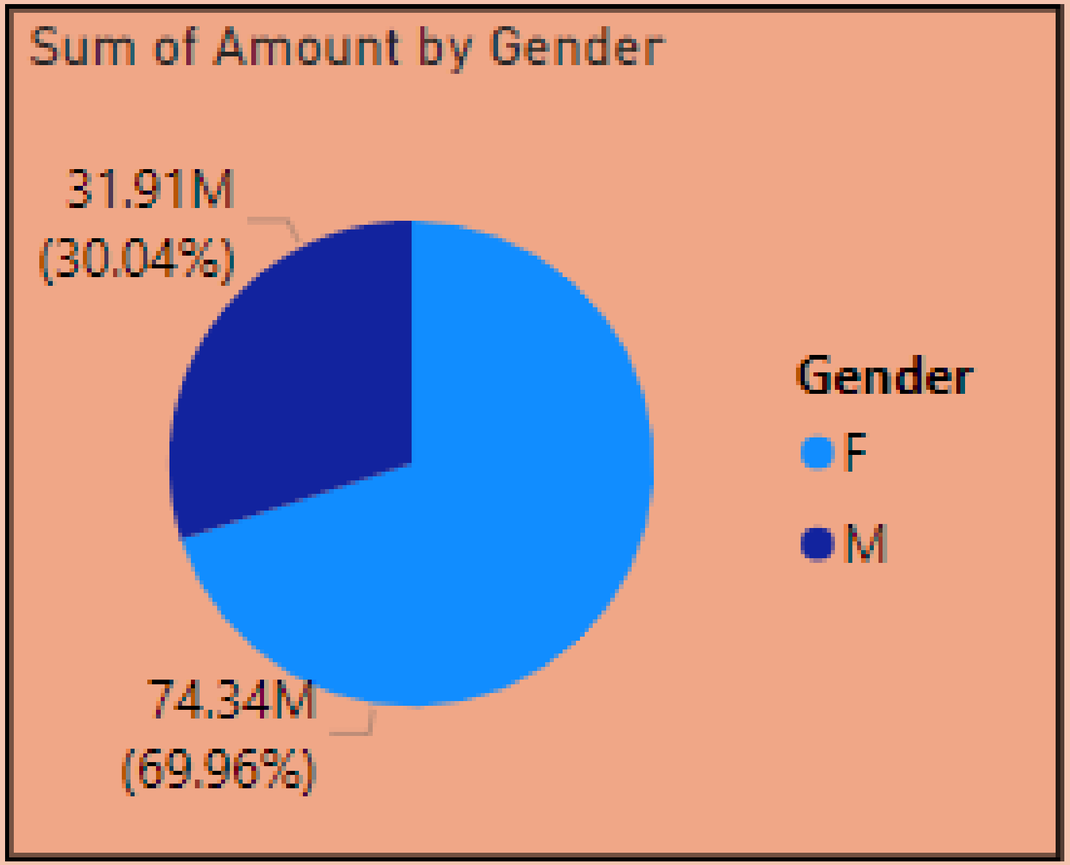
1. Which product categories generate the highest revenue during Diwali?

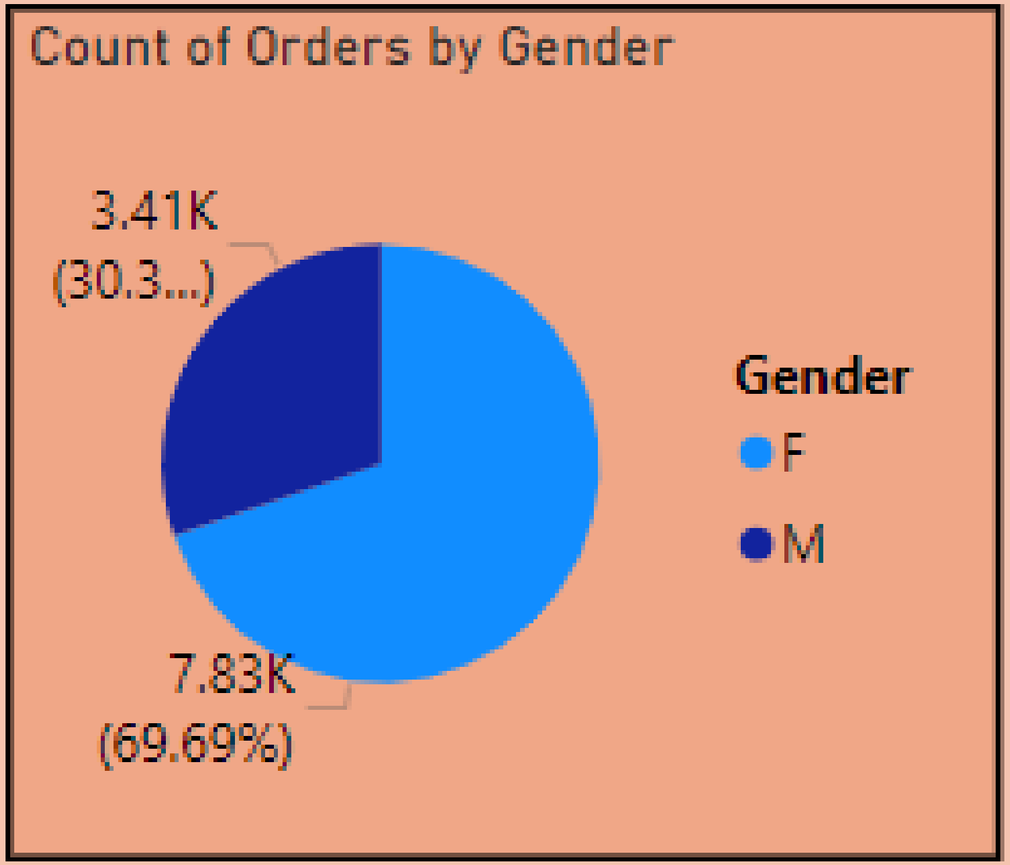


2. Which regions in India contribute the most to Diwali sales?



3. Who did more shopping man or Woman? and how much they spent?





4. How does spending differ between customers of different income levels?

Occupation	%GT Sum of Amount	Sum of Orders

Conclusion

The dataset reveals that the majority of shopping is done by females aged 25 to 35, with a higher spend on food and clothing. Merchants should focus on increasing stock in these categories while offering discounts on decor and Tupperware items to boost their sales.

By leveraging these insights, businesses can optimize marketing campaigns, enhance customer engagement, and maximize profits during peak shopping periods like Diwali
